

AI INTEGRATION PORTFOLIO

Research-driven AI integration that augments human labor.

I study how AI systems enter real work: how they change evaluation, accountability, job security, decision-making, safety workflows, and creative production. My focus is practical integration that improves human work rather than obscuring or replacing it.

703

participants recruited for a dissertation experiment on workplace AI integration.

685

valid responses analyzed across 16 AI-enabled workplace conditions.

20

AI professionals interviewed about accountability for bias mitigation.

1,540

GenAI forum posts/comments analyzed to understand creative workflow adoption.

39

interviews on AI-based moderation expectations in immersive communities.

2

HCI design contexts for AI-augmented decision support and moderation workflows.

INTEGRATION FRAMEWORK

Human role clarity

- What work remains human-owned?
- Where does AI assist, recommend, or act?
- How do teams assign credit and responsibility?

Evaluation and risk

- How does AI change performance evaluation?
- Does the system create job security concerns?
- What assumptions shape trust or overreliance?

Adoption and design

- Where do workflows need transparency?
- Which handoffs need guardrails?
- What interface cues help people use AI well?

SELECTED AI INTEGRATION CASEWORK

WORKPLACE AI | LABOR AUGMENTATION

AI-enabled workplace evaluation and job security

Tested how AI design, worker presentation, dyadic partner type, and task type shape evaluations of human workers.

- **Evidence:** 703 recruited, 685 valid responses, 16 conditions, SEM, expert interviews.
- **Outcome:** frameworks for evaluation risk, credit attribution, and job-security concerns during AI rollout.

AI GOVERNANCE | PROFESSIONAL PRACTICE

Accountability for AI bias mitigation

Interviewed AI professionals to understand why technical ability alone does not produce accountable AI practice.

- **Evidence:** 20 AI professionals across development roles and industries.
- **Outcome:** organizational and workflow factors that shape whether AI teams can own and mitigate risk.

DECISION SUPPORT | DASHBOARD UX

AI-augmented readiness dashboards

Worked on dashboard concepts for high-stakes readiness assessment, focusing on cognitive load, shared responsibility, and human oversight.

- **Evidence:** stakeholder-driven HCI design work and published decision-making insights.
- **Outcome:** design guidance for AI-supported dashboards where speed, accuracy, and accountability matter.

PLATFORM SAFETY | AI MODERATION

AI moderation and companion support in virtual communities

Studied how users expect AI moderation and AI companions to support safety without disrupting social interaction.

- **Evidence:** 39 interviews on AI moderation and 20 interviews on AI companion support.
- **Outcome:** guidance for transparency, escalation, user control, and human review.

GENERATIVE AI | CREATIVE LABOR

GenAI in nonprofit indie game development

Analyzed how creative communities perceive generative AI as a production tool, including where it supports work and where it conflicts with values.

- **Evidence:** 1,540 online posts/comments from creative community forums.
- **Outcome:** adoption insights for integrating GenAI without flattening craft, ownership, or community norms.

AI PRACTITIONER RESEARCH | DESIGN PRACTICE

AI design decisions and workplace dynamics

Interviewed AI practitioners to understand how workplace dynamics shape design decisions and responsible design practices.

- **Evidence:** eight AI practitioners interviewed about design and development practices.
- **Outcome:** design implications for AI teams building systems that affect workers and organizational evaluation.

WHAT THIS WORK GIVES AN ORGANIZATION

Integration risk models

Ways to anticipate how AI affects evaluation, credit, accountability, and worker confidence.

Research-backed design guidance

Recommendations for AI dashboards, moderation flows, companion support, and decision aids.

Adoption insights

Evidence on how professionals, creators, and workers perceive AI value, risk, and fit.

Cross-functional language

Frameworks that help product, research, policy, and engineering teams reason together.

BEST-FIT ROLES

AI integration and research

- Human-AI interaction researcher
- Responsible AI or AI governance researcher
- AI product / UX researcher

Human labor and adoption

- Workforce AI transformation research
- AI trust, safety, and moderation research
- Applied research for AI-enabled tools
